

Configuring Catchall

How to configure catchall?

Catchall is a type of virtual email address which retreats all emails sent to non-existing email addresses of your domain. If you have email accounts e.g. postmaster@domain.com and example@domain.com and someone sends emails to anything@domain.com, then address configured as catchall will catch those messages.

Catchall configuration

You may configure catchall in Manager.

1. Choose "Emails" section, then

Possible configuration:

By default, all caught messages are sent to postmaster account. However, other operations are possible:

- send back to sender: an error message is sent to the sender of the message,
- delete emails: the emails sent to the non existent addressee are deleted
- local redirection – send emails to your domains account
- other redirection – send emails to external account
