

The backups of SQL bases

**WARNING** : These backups only work on MyISAM tables. InnoDB tables are not compatibles with the snapshot system that we use.

The backups of your bases are automatically carried out:

- one of the last night (at about 4am),
- one of the last week (from the Sunday backup).

You may access to these backups by modifying the name of the base in phpMyAdmin:

- [name\_of\_the\_base]-n for the night backup,
- [name\_of\_the\_base]-s for the weekly backup.

The SQL server, the user name and the password of the base remain the same as the ones of your base.

Warning: You can only 'SELECT' on theses backups, you have no write-access.

For example:

sql base

Name of the sql base: **mysite**

Sql server: **sql2**

User name: **mysite**

Night sql backup

Name of the sql base: **mysite-n**

Sql server: **sql2**

User name: **mysite**

Weekly sql backup

Name of the sql base: **mysite-s**

Sql server: **sql2**

User name: **mysite**

### **How to recover these backups?**

You can follow the procedure at the following address:

How to save a data base?
